

The Evolution of the Market for Corporate Control

2025 Global Corporate Governance Colloquium (GCGC)

Mike Burkart (LSE)

Samuel Lee (Santa Clara)

Paul Voss (HEC Paris)

The traditional market for corporate control

Management teams compete over control of corporate resources in the economy

→ Inefficiently managed firms are taken over through **hostile takeovers**

Manager

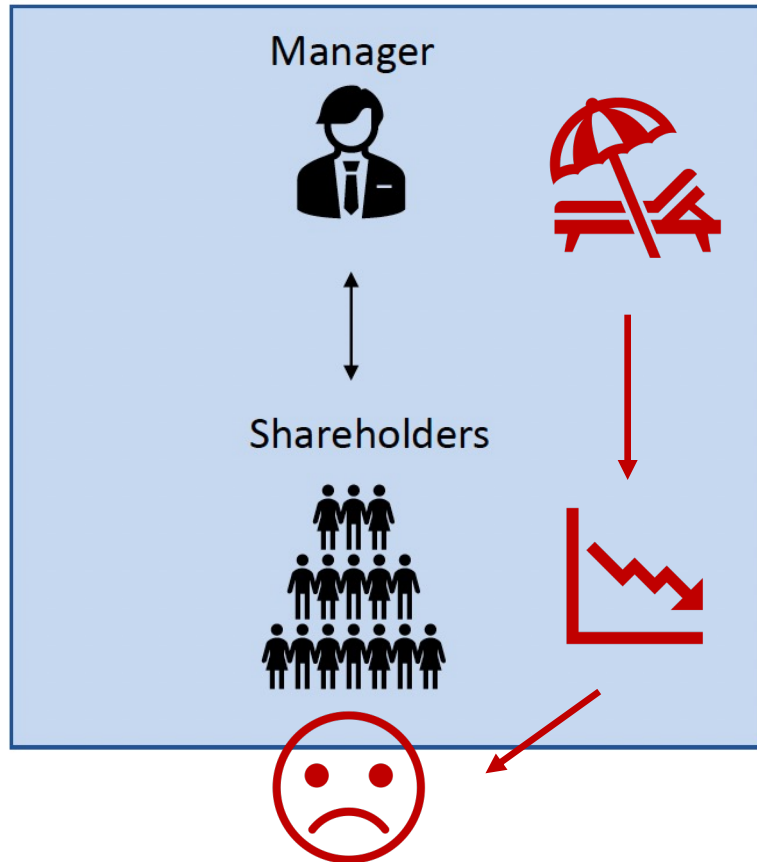

Shareholders

Acquires toehold
at low price

Hostile takeover: offers
to buy control

Manager

Shareholders

Hostile takeover: offers
to buy control

Sell majority of shares

Large activist shareholder

Hostile takeover: offers
to buy control

Sell majority of shares

Obtains control, improves management
and profits from value-increase (on toehold)

Two major problems:

1. **Free-riding:** small shareholders only sell at $P \geq E[\text{firm value after takeover} | P]$
2. **Asymmetric information:** Activist shareholder knows more than small shareholders

- Conjunction of 1. & 2. → too few hostile takeovers

Hostile takeover: offers to buy control

Sell majority of shares

Obtains control, improves management and profits from value-increase (on toehold)

The decline of hostile takeovers

Growth of capital under management of control investors (who orchestrate buyouts)

Capital at the disposal of...

activist hedge funds &

private equity (buyout) funds

exploded

No decline in buyouts

No decline in buyouts

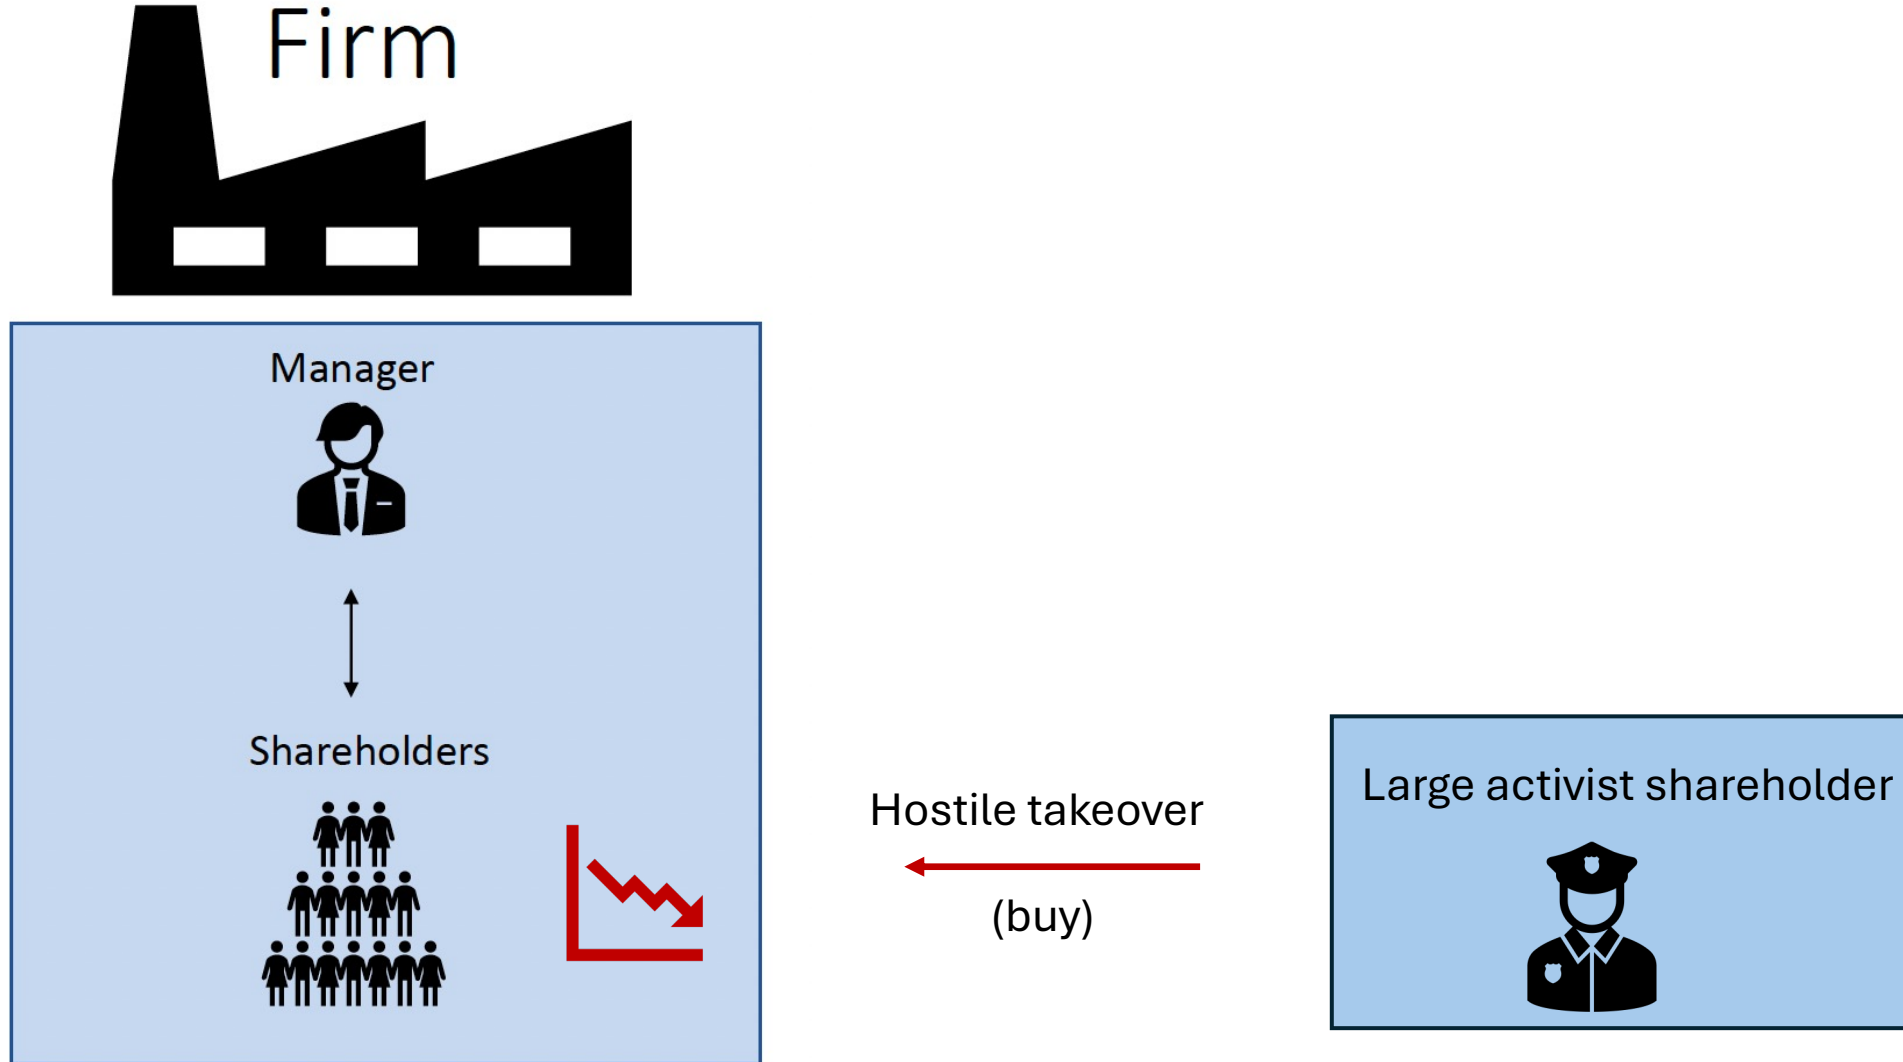

How is the **decline** in hostile takeovers and **rise** in buyouts consistent ?

Takeover activism

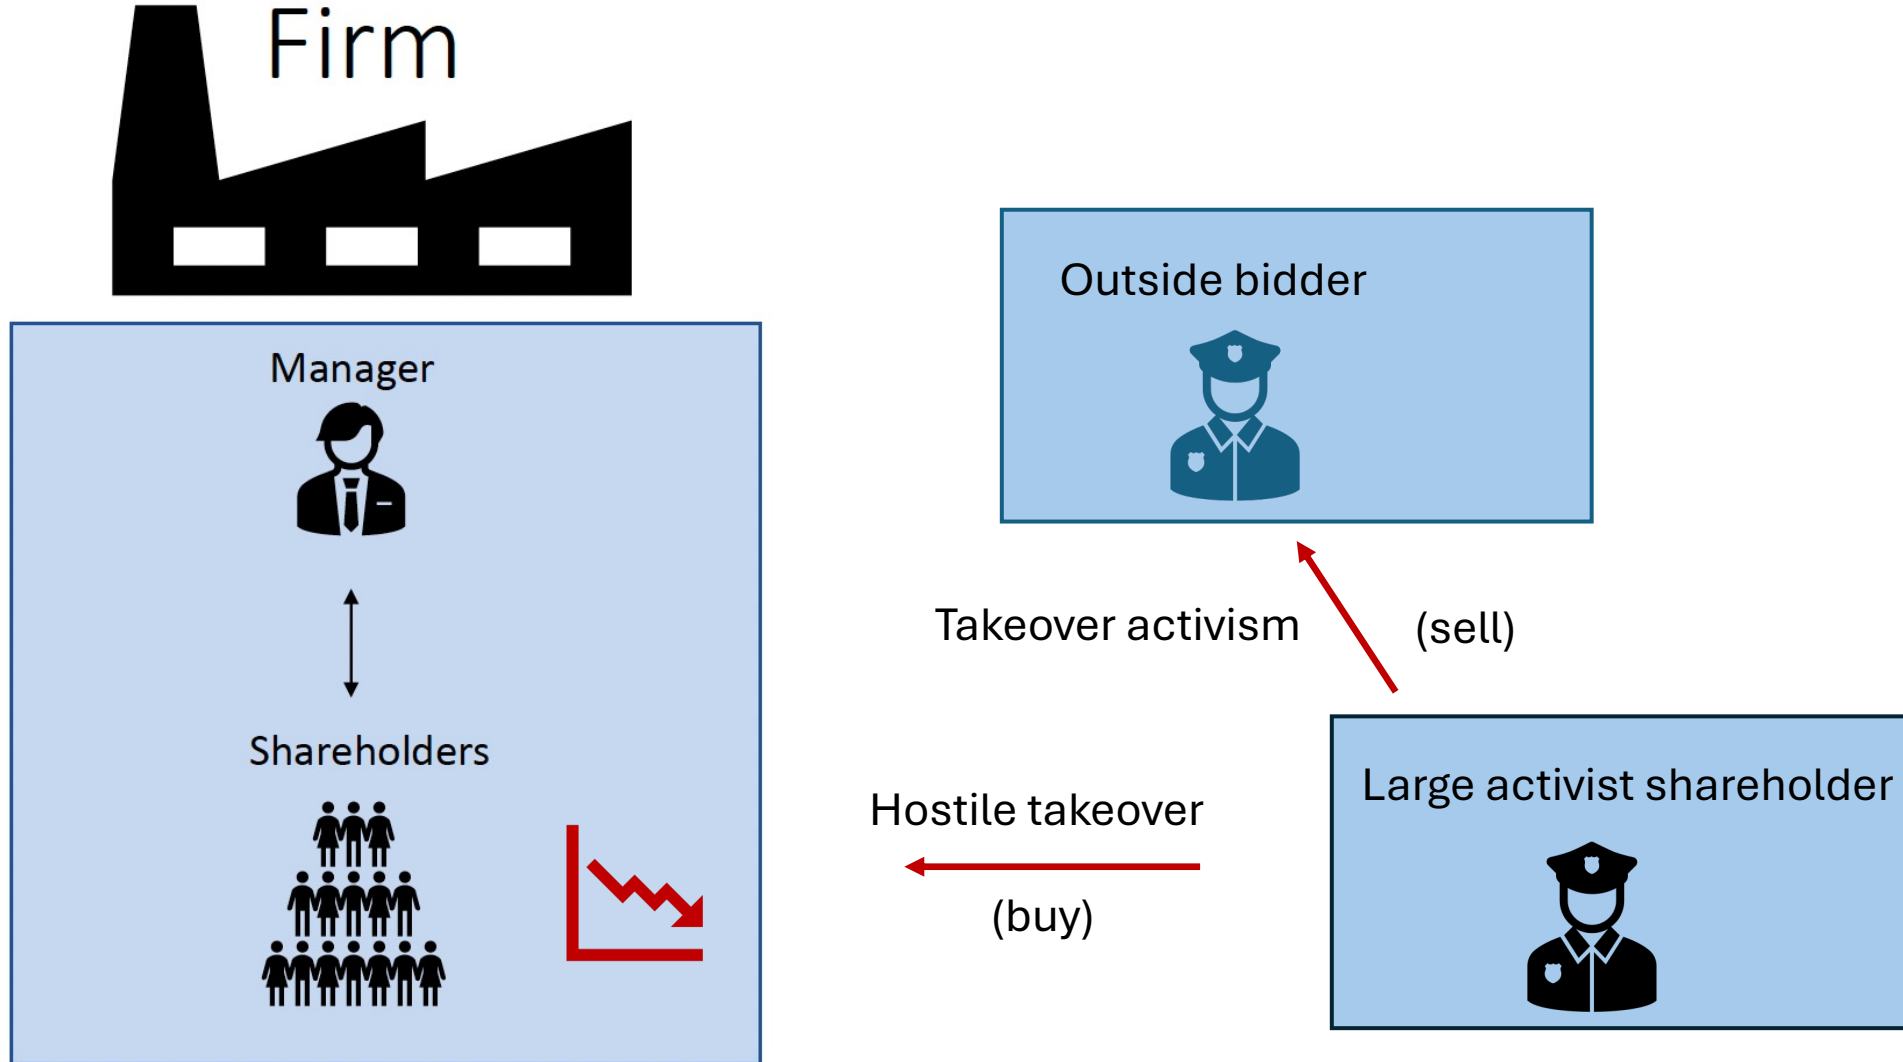

Activist shareholders rarely buy firms themselves anymore in a hostile takeover, but **broker a sale to outside buyers** (PE funds)

→ The emergence of takeover activism

What we do

What we do

Takes control and
improves firm value

Outside bidder

Takeover activism (sell)

Large activist shareholder

Hostile takeover

(buy)

Manager

Shareholders

Takeover activism improves efficiency

Adding the option to sell firm to outside bidder (takeover activism) enhances efficiency

1. Separates free-rider problem from the asymmetric information problem
2. The very choice between being on the buy- and sell-side allows the activist to credibly signal to dispersed small shareholders

→ Efficiency gains hold in a variety of settings

Market level framework

What happens as #control investors increases?

Evolution of the Market for Corporate Control

Evolution of the Market for Corporate Control

Early phase:

Only large shareholders
and hostile takeovers

Evolution of the Market for Corporate Control

Transformation phase:

- Outside bidders start entering
- Complementarity between large shareholders and outside bidders

Evolution of the Market for Corporate Control

Mature phase:

Market populated with enough large shareholders and outside bidders to realize control changes

Efficiency in the Market for Corporate Control

Efficiency in the Market for Corporate Control

Efficiency in the Market for Corporate Control

Concluding Remarks

The **shift** from hostile takeovers to takeover activism is **grounded in** the two fundamental frictions of **asymmetric information** and **free-riding**

Evolution naturally occurs as the market for corporate control expands and does not require any legal changes

Intermediated sales (takeover activism) enhance efficiency and lead to

``**sympiotic relationship of hedge funds and private equity**''

Thank you 😊
